TotalControlPro™

Manufacturing Platform

Activate each module as required, address immediate problems, solve immediate needs.

Energise our professional services, apply best practice to get the best results.

Synchronise connecting modules for live visibility of real-time processes from shop-floor to top-floor.

Manufacturing Execution System (MES)

Immediate implementation of MES solution provides full real-time visibility of your production process.

Productivity and audit trail of work orders, production stages and employee performance.

Utilise plug and play hardware for agile implementation of full tracking for process optimisation.

Our Manufacturing Execution System (MES) has multiple functionalities. It can be both a standalone module, as well as connect & synchronise data from the Customer Management System (CMS) and Stock & Inventory modules.

The MES module is designed to produce work orders and has the unique ability to engage production teams. You will have the capability to unlock traceability of where items are in the production environment, what stages the product has to go through and track both; employees and the product in regard to timings.

Through understanding and using data, you enable dramatic efficiency increases for your work force, improving processes and people. As well as traceability, the MES module can compare various reports and datasets including employee productivity, job expected vs job finished times and average times for products.

Our MES module provides complete data sets that are organised smartly and communicated clearly so you may make smarter, faster and better decisions.
